FOREWORD

Personal Health Choices is a joint publication of the Center for Health Information Analysis (CHIA) and the Department of Health and Human Services, Nevada State Health Division, Bureau of Health Planning and Statistics. The report presents Acute Care Hospital Inpatient Discharge Billing Records data for 39 common medical and surgical diagnoses by DRG (Diagnosis-Related Group) as reported by 32 of Nevada's acute care hospitals that discharged patients within the period of 2002 to 2006.

These data are available through the standard Uniform Billing form, which is utilized by hospitals to bill for their hospital charges. These data include patients who spent at least 24 hours as an inpatient, but do not include patients who were treated and released from the emergency room. It includes information about patients discharged from non-federal acute care hospitals in Nevada. These data identify billed charges, not the actual payments received by the hospital.

The data were compiled by CHIA using information from inpatient hospital billing records. This information was gathered and analyzed as part of a contractual agreement between the Department of Health and Human Services and the University under the authority granted in Section 439B of the Nevada Revised Statutes.

Personal Health Choices has been published annually since 1988 except for the 1991 and 1992 editions which were published concurrently in February 1994.

An electronic copy of this publication can be downloaded from http://www.unlv.edu/Research_Centers/chia/health_choices.htm

Additional hard copies of this publication are available for a fee of \$6.00 each including postage. Requests for copies and any other inquiries should be directed to:

INTRODUCTION

This nineteenth edition of Personal Health Choices compares 32 of Nevada's acute care hospitals with respect to 39 common medical diagnoses and surgical procedures, defined by Diagnosis Related Groups (DRGs: see below). The definitions to all DRG's can be found on the narrative page for each DRG.

THE DIAGNOSIS RELATED GROUP (DRG) SYSTEM

Diagnosis Related Group (DRG), is a classification system that is based on principal and secondary disease diagnoses, medical and surgical procedures, complications, comorbidities (coexisting conditions), age and discharge status. The DRG system is complex in its construction, and is based upon documentation in the patient's medical record. DRGs enable hospitals to recover the appropriate reimbursement for services rendered, evaluate the quality of care and assist in evaluating utilization of services. All principal diagnoses are divided into 25 exclusive categories, referred to as major diagnostic categories (MDCs). The MDCs are then further subdivided into DRGs. The DRG system's current 579 groups classify patients with similar utilization of hospital resources and length of stay patterns. Each DRG represents the average resources needed to treat patients grouped to that DRG compared to the national average of resources to treat all Medicare patients. Hospitals are reimbursed at a flat rate based on the theory that patients with similar illnesses undergoing similar procedures will require similar care. The primary outcome of the DRG system is that the more efficiently a hospital delivers care, the greater its operating margin will be.

INFORMATION LEVEL

Personal Health Choices is intended as a source of information regarding the billed charges of acute care hospitals in Nevada, and should not be construed as a definitive guide for selecting a hospital in order to receive inpatient medical care. The financial information in this report is based on billed charges rather than the amount actually collected on discharged patients per DRG. Billed charges and collected charges can differ significantly. This report should broaden the reader's knowledge about one component of healthcare pricing -- inpatient hospitalization -- which currently accounts for 30 to 35% of total healthcare expenditures. Hospital outpatient services as well as professional physician and other non-hospital inpatient ancillary healthcare services are not covered in this report.

FACTORS TO CONSIDER IN REVIEWING THIS REPORT

The information provided in this report is formatted so as to present narrative and tabular data on the first page and detailed tabular data on the second. This report covers a five-year trend line for DRG-related data. DRG's are sometimes broken down by age factors and/or presence of comorbidity. Comorbidity or comorbid conditions are defined as two or more coexisting medical conditions.

The first page of each selected DRG presents gender and age breakdowns of the overall hospital inpatient population, factored by the total number of discharges, average length of hospital stay and average billed charges. The age categories consist of 0-17, 18-35, 36-49, 50-64, and 65+. These age categories were selected to best illustrate the impact of the disease diagnoses and medical and surgical procedures on the populations affected. The narrative information on the first page for each DRG is based on the available data and may contain information on specific diagnoses and surgical procedures involved in the treatment of the patient. The second page examines specific hospitals in Clark, Washoe and the Rural counties. with regard to total discharges, average length of stays, and average billed charges.

It should be noted that, when comparing hospitals as to average length of stay and billed charges, information based on small numbers of cases cannot provide a reliable statistical base upon which information can reflect a given hospital's experience. Further, physician charges (including those of surgeons) are normally separate from hospital charges, except in rural areas where some physician services -- such as radiology, anesthesia, and laboratory tests -- may be included in the hospital charges.

HOSPITAL NAME CHANGES

Incline Village was previously known as Tahoe Hospital, then Tahoe Forest

Northeastern was previously known as Elko General

North Vista was previously known as Lake Mead

Renown Regional was previously known as Washoe Medical

Renown South Meadows was previously known as Washoe Village, then Washoe South Meadows

GENERAL ACUTE CARE HOSPITALS

Hospital Name	Address	Phone	Beds	County
Battle Mountain General Hospital	535 Humboldt St., Battle Mountain, NV 89820	(775) 635-2550	25	Lander
Boulder City Hospital	901 Adams Blvd., Boulder City, NV 89005	(702) 293-4111	67	Clark
Carson Tahoe Regional Medical Center	1600 Medical Parkway, Carson City, NV 89703	(775) 445-8000	144	Carson
Carson Valley Medical Center	2155 South Ave. South Lake Tahoe, CA 96150	(530) 543-5812	23	Douglas
Churchill Community Hospital	801 E. Williams Ave., Fallon, NV 89406	(775) 423-3151	40	Churchill

DRG 449	Poisoning & Toxic Effects of Drugs, Age > 17 with Comorbid Condition(s)	71-72

012: DEGENERATIVE NERVOUS SYSTEM DISORDERS

Description: The most common diagnosis codes used in Nevada in 2004, for this DRG were Alzheimer's disease (ICD-9 code 331.0), unspecified hypertension (ICD-9 code 401.9), dementia with behavioral disturbance (ICD-9 code 294.11), dementia without behavioral disturbance (ICD-9 code 294.11), and depressive disorder NEC (ICD-9 code 311).

Definitions: **Alzheimer's disease:** a progressive mental deterioration characterized by confusion, disorientation, restlessness, and hallucinations. Only palliative treatment is available. **Hypertension:** elevated blood pressure persistently exceeding 140/90. Essential hypertension, the most common kind, has no single identifiable cause. **Dementia:** a progressive organic mental disorder characterized by chronic confusion, disorientation, stupor, impaired judgment and impulses. Organic forms of dementia are generally considered irreversible, progressive and incurable. However, conditions that cause the decline may be treatable or partially reversible. **Depression:** an abnormal emotional state characterized by exaggerated feelings of sadness, dejection, worthlessness, emptiness and hopelessness that are out of proportion to reality.

014: SPECIFIC CEREBROVASCULAR DISORDERS EXCEPT T.I.A.

Diagnosis: In 2004, cerebrovascular diseases (AKA stroke) were the fourth leading cause of death in Nevada. In 2004, in Nevada 5.71% of all deaths were due to cerebrovascular diseases. The age-adjusted death rate, in Nevada was 52.6 per 100,000 population. The most common diagnoses for this DRG are intracranial hemorrhage (ICD-9 code 431), cerebral embolism with cerebral infarction (ICD-9 code 434.11) and cerebral artery occlusion with cerebral infarction (ICD-9 code 434.91) and cerebrovascular accident (ICD-9 code 436).

Definitions: **Cerebral:** referring to the brain. **Embolism:** a foreign object, quantity of air or gas, tissue or blood clot that circulates in the bloodstream until it becomes lodged in a vessel. **Intracranial:** the area within the skull. **Cerebrovascular:** the blood vessels and blood supply pertaining to the brain. **Hemorrhage:** a sudden loss of a large amount of blood in a short period, either internally or externally. **Infarction:** a localized area of dead tissue resulting from a lack of oxygen. It is caused by an interruption of the blood supply to the area or the occlusion of a blood vessel. **Occlusion:** a blockage in a canal, vessel or passage of the body. **T.I.A.:** transient ischemic attack, an episode of cerebrovascular insufficiency, usually associated with a partial occlusion of a cerebral artery by plaque or an embolus. **Cerebrovascular accident:** (AKA stroke) an abnormal condition characterized by an occlusion, embolus, blood clot, hemorrhage or vasospasm resulting in a lack of blood flow to the brain tissues.

015: TRANSIENT ISCHEMIC ATTACK & PRECEREBRAL OCCLUSIONS

Diagnosis: The principal diagnosis codes most commonly grouped to this DRG include occlusion and stenosis of the carotid artery without mention of cerebral infarction (ICD-9 code 433.10) and transient ischemic attacks (ICD-9 code 435.9) and transient cerebral ischemia (ICD-9 code 435.8).

Definitions: **Transient ischemic attack:** an episode of cerebrovascular insufficiency, usually associated with partial occlusion of a cerebral artery by an atherosclerotic plaque or an embolus. The symptoms vary with the site and degree of occlusion. Disturbance of normal vision, dizziness, weakness, dysphasia, numbness or unconsciousness may occur. The attack can last a few minutes, in some cases symptoms continue for several hours. **Transient:** a condition that is temporary. **Ischemic:** a decreased supply of oxygenated blood. **Carotid:** refers to the arteries that supply oxygenated blood to the head and neck. **Stenosis:** constricting and narrowing of an opening or passageway. **Atherosclerotic:** yellowish plaques of cholesterol and cellular debris in the inner layers of the walls of the arteries. **Cerebrovascular:** the blood vessels and blood supply pertaining to the brain. **Embolism:** a foreign object, quantity of air or gas, tissue or blood clot that circulates in the bloodstream until it becomes lodged in a vessel. **Cerebral infarction:** (AKA cerebrovascular accident (CVA)/stroke), an occlusion by an embolus, hemorrhage or vasospasm resulting in ischemia to the brain tissues.

024: SEIZURE & HEADACHE. AGE > 17 W CC

Definitions: **Seizure:** Hyperexcitation of neurons in the brain leading to a sudden, violent, involuntary series of contractions of a group of muscles. It may be episodic, as in a seizure disorder, or it may be acute, as after a head concussion. Focal seizures begin as spasmodic movements in the hand, face or foot. It may be manifested by chewing, lip smacking, swallowing movements and profuse salivation. **Headache:** a pain in the head from any cause. Kinds of headaches include cluster headache, functional headache, histamine headache, migraine headache, organic headache, sinus headache and tension headache. **Cluster headache:** a migraine-like condition characterized by intense pain over the eye and forehead. **Histamine headache:** a headache associated with the release of histamine from the body and marked by symptoms of dilated carotid arteries, fluid accumulation under the eyes, tearing and a runny nose. **Migraine:** a recurring vascular headache related to dilation of extracranial blood vessels. **Organic headache:** a headache caused by a wide variety of intracranial disorders. **Tension headache:** a pain that affects the head as a result of overwork or emotional strain and involves tension in the muscles of the neck, face and shoulder.

075: MAJOR CHEST PROCEDURES

Description: These are procedures which involve surgery on structures within the chest cavity, excluding the heart. The most common procedures are those involving the lungs and the esophagus.

In Nevada in 2004, the most common procedures under DRG 075 were lobectomies of the lung (ICD-9 code 32.4), fiber-optic bronchoscopy (ICD-9 code 33.22), decortication of the lung (ICD-9 34.51), other local excision or destruction of a lesion or tissue of the lung, and insertion of intercostal catheter (chest tube) for drainage (ICD-9 code 34.04).

Procedures (included but not limited to): **Bronchoscopy:** evaluation of all the major airways through a scope (a thin tube with a light on the end). **Thoroscopy:** surgery on the chest cavity through small incisions, aided by camera-mounted scopes. This is usually done for lung biopsies, treatment of fluid in the chest, or to treat a pneumothorax.

Wedge resection: the surgical removal of a small wedge shaped portion of the lung. **Lobectomy:** surgical removal of a lobe or section of the lung. **Decortication:** removal of portion of the surface of the lung. **Intercostal:** the space between two ribs.

079: RESPIRATORY INFECTIONS & INFLAMMATIONS. AGE > 17 W CC

Diagnosis: The most common diagnoses associated with DRG 079 are pneumonia due to pseudomonas (ICD-9 code 482.1), pneumonia due to staphylococcus (ICD-9 code 482.40), pneumonia due to gram-negative organisms (ICD-9 code 482.83), and pneumonia due to inhalation of food or vomitus (ICD-9 code 507.0).

Definitions: Pneumonia: an acute inflammation of the lungs. **Pseudomonas:** a genus of gram-negative bacteria that includes several free-living species in soil and water and some opportunistic pathogens. **Staphylococcus:** an infection caused by any one of several pathogenic species. Staphylococcus pneumonia often follows other viral disease and may be associated with chronic or debilitating illness. **Pathogen:** a microorganism capable of producing disease. **Aspiration pneumonia:** an inflammatory condition of the lungs and bronchi caused by inhalation of foreign material or vomitus.

088: CHRONIC OBSTRUCTIVE PULMONARY DISEASE

Diagnosis: The most common diagnoses in this DRG are chronic obstructive bronchitis with acute exacerbation (ICD-9 code 491.21), chronic obstructive asthma without mention of status asthmaticus (ICD-9 code 493.20) and, chronic obstructive pulmonary disease (COPD) (ICD-9 code 496).

Definitions: Chronic obstructive pulmonary disease: a progressive and irreversible condition characterized by diminished inspiratory and expiratory capacity of the lungs. It includes asthma, chronic bronchiectasis, chronic bronchitis and emphysema. The condition is aggravated by cigarette smoking and air pollution. **Exacerbation:** an increase in the seriousness of a disease or disorder as marked by greater intensity in the signs or symptoms of the patient being treated. **Asthma:** a respiratory disorder characterized by recurring episodes of breathing difficulty, wheezing on expiration and/or inspiration caused by constriction of the bronchi, coughing and thick bronchial secretions. **Status asthmaticus:** an acute, severe, and prolonged asthma attack. Hypoxia, cyanosis and unconsciousness may follow, and the attack may be fatal. **Hypoxia:** inadequate oxygenation characterized by an high heart rate, high blood pressure, dizziness and mental confusion. **Cyanosis:** a bluish discoloration of the skin caused by an excess of deoxygenated blood. **Bronchiectasis:** an abnormal condition of the bronchial tree characterized by irreversible dilation and destruction of the bronchial walls.

089: SIMPLE PNEUMONIA & PLEURISY. AGE > 17 W CC

Diagnoses: The ICD-9 codes most commonly grouped to this DRG are pneumococcal pneumonia (ICD-9 code 481), and, pneumonia, organism unspecified (ICD-9 code 486).

Definitions: W CC: the presence of complications and comorbidities, i.e., alcoholism, congestive heart failure, dehydration, diabetes, malnutrition, renal failure. **Pneumonia:** an acute inflammation of the lungs, often caused by inhalation of the species streptococcus pneumoniae. The alveoli and bronchioles of the lungs become plugged with fibrous secretions. **Alveoli:** a small outpouching in the lungs through which gas exchanges from the pulmonary capillary blood. **Bronchioles:** a small airway of the respiratory system extending from the bronchi into the lobes of the lung. **Pleurisy:** inflammation of the membrane enclosing the lung. **Capillary:** microscopic blood vessel joining arteries and veins. Blood and tissues exchange various substances across the capillary walls.

098: BRONCHITIS & ASTHMA. AGE 0-17

Description: The most common diagnosis codes used in Nevada in 2004, for this DRG were acute bronchiolitis due to respiratory syncytial virus (RSV) (ICD-9 code 466.11, acute exacerbation of chronic obstructive asthma (ICD-9 code 493.92), acute bronchiolitis due to other infectious organisms (ICD-9 code 466.10), asphyxia (ICD-9 code 799.0), and asthma, unspecified (ICD-9 code 493.90).

Definitions: Bronchitis: an acute or chronic inflammation of the mucous membranes of the tracheobronchial tree. Acute bronchitis is characterized by a productive cough, fever, increased mucus secretion and back pain. Chronic bronchitis is a common debilitating pulmonary disease, characterized by greatly increased production of mucus by the glands of the trachea and bronchi and results in a productive cough for at least 3 months of the year for more than two consecutive years. **Asthma:** a respiratory disorder characterized by recurring episodes of breathing difficulty, wheezing on expiration and/or inspiration caused by constriction of the bronchi, coughing and thick bronchial secretions. **Asphyxia:** severe lack of oxygen leading to loss of consciousness and possibly death. **Bronchiolitis:** acute viral infection of the lower respiratory tract, primarily in infants less than 18 months of age.

110: MAJOR CARDIOVASCULAR PROCEDURES W CC

Description: The most common diagnosis codes used in Nevada in 2004, for this DRG were implant of pulsation balloon (ICD-9 code 37.61), coronary arteriography using two catheters (ICD-9 code 88.56), left heart catheterization (ICD-9 code 37.22) and aorta-iliac-femoral bypass (ICD-9 code 39.25). Cardiovascular procedures include (but are not limited to) diagnostic cardiac catheterization, coronary artery bypass graft procedures, cardiac pacemaker procedures, and heart valve procedures.

Definitions: W CC: with complications and comorbidities (an accompanying illness/es). **Cardiovascular disease:** any abnormal condition characterized by dysfunction of the heart and blood vessels. **Atherosclerosis:** yellowish plaques of cholesterol, other lipids and cellular debris in the inner layers of the walls of arteries. **Cardiac catheterization:** a diagnostic procedure in which a catheter is introduced into a large vein and threaded through the circulatory system to the heart. **Bypass:** A procedure to divert the flow of blood thereby bypassing a narrowing or blockage in a blood vessel. **Aneurysm:** a localized dilation of the wall of a blood vessel. **Arteriography:** radiologic visualization of arteries after a radioopaque contrast medium is introduced into the bloodstream. **Catheter:** a hollow flexible tube that can be inserted into a vessel or cavity of the body.

116: OTHER PERMANENT CARDIAC PACEMAKER IMPLANT

Diagnosis: The most common operation/procedure codes used in Nevada in 2004, for this DRG were initial insertion of dual chamber pacemaker device (ICD-9 code 37.83), initial insertion of transvenous leads (electrodes into atrium and ventricle (ICD-9 code 37.72), initial insertion of transvenous lead (electrode) into ventricle (ICD-9 code 37.71), and initial insertion of single-chamber pacemaker device, not specified as rate responsive (ICD-9 code 37.81).

Definition: Cardiac pacemaker: an electric apparatus used in most cases to increase the heart rate by electrically stimulating the heart muscle. A pacemaker may emit the stimulus at a constant and fixed rate, or fire only on demand. A thin, insulated wire is inserted through a vein to connect the pacemaker to the heart.

Beginning fiscal 2002, with the addition of DRG 516 (percutaneous cardiovascular procedures with acute myocardial infarction) and DRG 517 (percutaneous cardiovascular procedures without acute myocardial infarction with coronary artery stent implant) many who might have been classified under 116 were now found under these DRGs. This pattern was repeated in fiscal 2004 with the addition of DRG 526 (percutaneous cardiovascular procedure with drug-eluting stent with acute myocardial infarction) and DRG 527 (percutaneous cardiovascular procedure with drug-eluting stent without acute myocardial infarction).

Note: DRG 116 was discontinued October 1, 2005 and will be removed from Choices in the future.

122: CIRCULATORY DISORDERS W AMI W/O MAJOR COMP. DISCHARGED ALIVE

Definitions: **W AMI:** with an acute myocardial infarction. **W/O Major Comp:** without major complications. **Acute myocardial infarction:** (AKA heart attack) the early critical stage of necrosis of heart muscle tissue caused by a blockage of a coronary artery. **Necrosis:** Localized tissue death that occurs in groups of cells in response to disease or injury. **Coronary artery(s):** The heart has two main coronary arteries, the right and the left. The right coronary artery curves around the right side of the heart to supply blood to the front and back of that side. The left coronary artery supplies blood to the left side of the heart and has two distinct branches. Atherosclerosis is the most common reason for the blockage of blood vessels. Atherosclerosis occurs when fat and cholesterol build up on the inside walls of hardened arteries. This build-up blocks or narrows the artery and prevents blood and oxygen from reaching the heart muscle.

Diseases of the heart was the leading cause of death in Nevada in 2004, with an age-adjusted rate of 233.92 deaths per 100,000 population. 26.28% of all deaths in 2004 in Nevada, were due to heart disease.

125: CIRCULATORY DISORDERS EXCEPT AMI, W CARD CATH W/O COMPLEX DIAG

Diagnosis: The most common principal diagnosis codes for this DRG are coronary atherosclerosis of native coronary artery disease (ICD-9 code 414.01), unspecified chest pain (ICD-9 code 786.50), and chest pain NEC (ICD-9 code 786.59).

Definitions: **Except AMI:** except acute myocardial infarction (heart attack). **W Card Cath:** with cardiac catheterization. **W/O Complex Diag.:** without a complex diagnosis. **Coronary atherosclerosis:** when fat and cholesterol build up on the inside walls of the coronary hardened artery(s). This build-up blocks or narrows the artery and prevents blood and oxygen from reaching the heart muscle. **Cardiac catheterization:** a diagnostic procedure in which a catheter is introduced into a large vein and threaded through the circulatory system to the heart. **Coronary heart disease:** an abnormal condition that affects the heart's arteries and produces reduced flow of oxygen and nutrients to the muscles of the heart. It is the leading cause of death in the Western world. **Chest pain:** a physical complaint that requires immediate diagnosis and evaluation. Chest pain can be a sign of cardiac disease, or of pulmonary (lung) disease. Over 90% of severe chest pain is caused by coronary artery disease, spinal root compression or a psychological disturbance. **NEC:** means not elsewhere classifiable.

127: HEART FAILURE & SHOCK

Diagnosis: The diagnosis codes most commonly grouped to this DRG are hypertensive heart disease with congestive heart failure (ICD-9 code 402.91), and congestive heart failure (ICD-9 code 428.0).

Definitions: Heart failure: a condition in which the heart cannot pump enough blood to meet the requirements of the body tissues. Heart failure is closely associated with many forms of heart disease, most of which affect the left side of the heart. Clinicians divide heart failure into left-sided heart failure and right-sided heart failure. **Congestive heart failure:** impaired cardiac pumping, failure of the ventricles to eject blood efficiently results in volume overload. **Shock:** an abnormal condition of inadequate blood flow to the body's tissues, with life-threatening cellular dysfunction. **Hypertensive heart disease:** is a late complication of hypertension (high blood pressure) that affects the heart. Hypertension increases the workload of the heart and over time, this can cause thickening of the heart muscle and the symptoms of hypertensive heart disease. As the heart continues to pump against elevated pressure in the blood vessels, the left ventricle becomes enlarged and the amount of blood pumped by the heart each minute goes down, and without treatment, symptoms of congestive heart failure may develop.

132: ATHEROSCLEROSIS W CC

Diagnosis: The most common diagnosis codes used in Nevada in 2004, for this DRG were coronary atherosclerosis of native coronary artery (ICD-9 code 414.01), essential hypertension, unspecified (ICD-9 code 401.9), other acute and subacute forms of ischemic heart disease, intermediate coronary syndrome (ICD-9 code 411.1), disorder of lipid metabolism, other and unspecified hyperlipidemia (ICD-9 code 272.4), and coronary atherosclerosis of unspecified type of vessel, native or graft (ICD-9 code 414.00).

Definitions: W CC: with complications and comorbidities (an accompanying illness/es). **Coronary atherosclerosis:** when fat and cholesterol build up on the inside walls of the coronary hardened artery(s). This build-up blocks or narrows the artery and prevents blood and oxygen from reaching the heart muscle. Coronary atherosclerosis is the major cause of myocardial infarctions (heart attacks). Heart attacks are the major cause of sudden unexpected death among otherwise health adults in the prime of their lives. **Ischemia:** a decreased supply of oxygenated blood to a body part. **Hyperlipidemia:** an excess of lipids (cholesterol, fatty acids, phospholipids and triglycerides) in the plasma (the liquid part of the blood).

138: CARDIAC ARRHYTHMIA & CONDUCTION DISORDERS W CC

Diagnosis: The most common diagnosis codes for this DRG are paroxysmal ventricular tachycardia (ICD-9 code 427.1), atrial fibrillation (ICD-9 code 427.31), atrial flutter (ICD-9 code 427.32), sinoatrial node dysfunction (ICD-9 code 427.81).

Definitions: W CC: with complications and comorbidities (an accompanying illness(es)). **Paroxysmal ventricular tachycardia:** a rapid heartbeat of sudden onset and termination caused by a quick succession of discharges from an ectopic (an impulse that originates in the heart at a site other than the sinus node) site in the ventricle. **Atrial fibrillation:** a cardiac arrhythmia characterized by disorganized electrical activity in the atria accompanied by an irregular ventricular response that is usually rapid. The atria quiver instead of pumping in an organized fashion, increasing the risk of stroke. **Atrial flutter:** a type of atrial tachycardia (rapid beating of the atria) characterized by contraction rates between 230-380 beats per minute. **Sinoatrial node dysfunction:** any disturbance in the normal functioning of the sinoatrial node (a cluster of hundreds of cells located in the right atrial wall of the heart. It's comprised of heart muscle that generates impulses that travel swiftly throughout the both atria, causing them to contract). **Cardiac dysrhythmias:** any abnormality in a cardiac rhythm pattern.

143: CHEST PAIN

Diagnosis: The most common diagnosis codes for this DRG are chest pain, unspecified (ICD-9 code 786.50), and chest pain NEC (ICD-9 code 786.59).

Definitions: NEC: not elsewhere classifiable. **Chest pain:** a physical complaint that requires immediate diagnosis and evaluation. Chest pain can be a sign of cardiac disease, such as angina pectoris, myocardial infarction (AKA heart attack), pericarditis, or of pulmonary (lung) disease, such as pleurisy, pneumonia or pulmonary embolism or infarction. Use of illegal drugs such as cocaine may also cause chest pain. Less common, but also life-threatening conditions that cause chest pain include aortic dissection and pneumothorax. **Angina:** a spasmodic choking feeling at rest. **Aortic dissection:** a localized dilation of the aorta, characterized by longitudinal separation of the outer and middle layers of the vascular wall. **Pulmonary embolism:** a blockage of the pulmonary artery by fat, tumor tissue or a blood clot. **Pneumothorax:** the presence of air or gas in the pleural space (the embrane enclosing the lung containing a small amount of fluid for lubrication), causing the lung to collapse. **Pericarditis:** inflammation of the fibroserous sac that surrounds the heart.

148: MAJOR SMALL & LARGE BOWEL PROCEDURES W CC

Procedures: Surgical procedures under DRG 148 include but are not limited to, resections of the bowel, permanent or temporary colostomies, ileostomies, repair of abnormal passages known as fistulas, and the surgical joining of sections of the bowel known as an anastomosis.

In Nevada in 2004, the most common procedures under DRG 148 were resections of partial sections of the small intestine (ICD-9 code 45.62), right hemicolectomies (ICD-9 code 45.73) and sigmoidectomies (ICD-9 code 45.76).

Definitions: W CC: means with complications and comorbidities (an accompanying illness/es). **Resection:** the cutting out of a significant part of an of an organ or struction, may be partial or complete. **Hemicolectomy:** excision of approximately half of the colon. **Sigmoidectomy:** excision of the sigmoid flexure of the colon. A **colostomy** and an **ileostomy** are surgical formations of an opening onto the surface of the abdomen from which waste from the bowel is emptied. These procedures may be performed in cases of cancer of the colon, benign obstructive tumors, severe abdominal wounds, severe ulcerative colitis, and Crohn's disease.

Description: The small intestine, (small bowel) is a tubelike structure that winds back and forth in the abdominal cavity for about 23 feet. It is an organ of digestion and it is the chief organ of absorption. The large intestine (large bowel) is wider in diameter. The large intestine is about 5 feet long.

167: APPENDECTOMY W/O COMPLICATED PRINCIPAL DIAG W/O CC

Procedure: An appendectomy is the surgical removal of an inflamed or infected appendix. The appendix is a small, finger-shaped pouch of intestinal tissue extending from the cecum, which is the first part of the large intestine. The infected appendix must be surgically removed because if it leaks, this can lead to an infection of the entire abdominal space, which can be fatal.

A small incision is made in the right lower quadrant of the abdomen and the appendix is removed. The appendix may be removed laparoscopically (with a smaller incision, using a tiny camera to visualize the area). If a pocket of infection or abscess has formed or the appendix has ruptured, the abdomen will be thoroughly washed out during surgery and a small tube may be left in to help drain fluids and purulent matter, and appropriate antibiotics prescribed.

Definitions: **Appendicitis:** a sudden inflammation of the appendix. **W/O CC:** without complications and comorbidities (an accompanying illness/es). **W/O complicated principal diag.:** without a complicated principal diagnosis. **Purulent:** containing pus, a creamy fluid that is the result of fluid remains of necrosis of tissues.

174: G.I. HEMORRHAGE W CC

Description: Hemorrhage is the loss of a large amount of blood in a short period of time. Gastrointestinal (GI) hemorrhage can occur in the esophagus, stomach, duodenum, and small and large intestine. Causes of hemorrhage of the GI tract include but are not limited to, esophageal varices, stomach ulcers, duodenal ulcers, peptic ulcers, acute gastritis, diverticulitis, and diverticulosis.

The top diagnosis codes most commonly used in Nevada in 2004, for this DRG were iron deficient anemia secondary to chronic blood loss (ICD-code 280.0), hemorrhage of gastrointestinal tract, unspecified (ICD-9 code 578.9), acute post hemorrhagic anemia (ICD-9 code 285.1), and anemia, unspecified (ICD-9 code 285.9).

Definitions: W CC: with complications and comorbidities (an accompanying illness/es). **Esophageal varices:** enlarged and swollen veins at the lower end of the esophagus. **Diverticulosis:** is the presence of pouchlike herniations through the muscular layer of the colon. **Diverticulitis:** inflammation of one or more of these pouchlike herniations. **Duodenum:** the first part of the small intestine. It is located below the stomach. **Anemia:** a decrease in hemoglobin (a compound in the blood that carries oxygen to the cells from the lungs and carbon dioxide away from the cells to the lungs) in the blood to levels below normal.

182: ESOPHAGITIS, GASTROENT & MISC DIGEST DISORDERS AGE > W CC

Diagnosis: Under this DRG, diagnoses include, but are not limited to, intestinal infections, esophageal reflux, noninfectious gastroenteritis, and diverticulitis of the colon. The top diagnosis codes most commonly used in Nevada in 2004, for this DRG were disorders of fluid, electrolyte and acid/base balance, volume depletion (ICD-9 code 276.5), other and unspecified noninfectious gastroenteritis and colitis (ICD-9 code 558.9), esophageal reflux (ICD-9 code 530.81), hypopotassemia (ICD-9 code 276.8) and diverticulitis of colon (without mention of hemorrhage) (ICD-9 code 562.11).

Definitions: Esophagitis: inflammation of the mucosal lining of the esophagus. It can be caused by infection, or backflow of gastric juices from the stomach.

Gastroenteritis: inflammation of the stomach and intestines accompanying numerous gastrointestinal disorders. **Diverticulitis:** inflammation of one or more pouchlike herniations through the muscular layer of the colon. **Reflux:** an abnormal backward flow of a fluid. **Hypopotassemia:** a deficiency of potassium in the blood.

202: CIRRHOSIS & ALCOHOLIC HEPATITIS

Description: The liver is the largest organ in the human body. The liver helps the body digest fats, stores reserves of nutrients, filters poisons and wastes from the blood, synthesizes proteins, and regulates the levels of many chemicals found in the bloodstream.

Definitions: **Cirrhosis:** a chronic liver disease that causes scarring of the liver and liver dysfunction. This often has many complications, including accumulation of fluid in the abdomen (ascites), bleeding disorders (coagulopathy) increased pressure in the blood vessels (portal hypertension) and confusion or a change in the level of consciousness (hepatic encephalopathy). Common causes include hepatitis C and alcohol use. **Hepatitis:** inflammation of the liver, characterized by anorexia, abdominal and gastric discomfort and abnormal liver function. **Portal hypertension:** an increased venous pressure in the portal circulation caused by compression or occlusion in the portal or hepatic vascular system. **Coagulopathy:** a disease process that affect the ability of the blood to coagulate (clot). **Hepatitis C:** a type of hepatitis most commonly transmitted by blood transfusion or, used needle puncture.

204: DISORDERS OF PANCREAS EXCEPT MALIGNANCY

Diagnosis: Diagnoses in DRG 204 include, but are not limited to, pancreatitis, benign neoplasms of the pancreas, pancreatic disease, and pancreas injury. The top diagnosis codes most commonly used in Nevada in 2004, for this DRG were acute pancreatitis (ICD-9 code 577.0), chronic pancreatitis (ICD-9 code 577.1), hypopotassemia (ICD-9 code 268.8), and cyst and pseudocyst of the pancreas (ICD-9 code 577.1).

Description: The pancreas is a small organ, approximately six inches long, located in the upper abdomen, and connected to the small intestine. The pancreas produces enzymes that help digest protein, fat and carbohydrates before they can be absorbed through the intestine and it makes islands of endocrine cells that produce insulin which regulate the use and storage of the body's main energy source, glucose and sugar.

Definitions: **Pancreatitis:** inflammation of the pancreas. Inflammation occurs when the digestive enzymes attack the pancreas. The inflammation may occur suddenly or develop over many years. **Neoplasm:** any abnormal growth of new tissue. Benign means noncancerous. **Malignancy:** describing a cancer. **Hypopotassemia:** a deficiency of potassium in the blood. **Pseudocyst:** a space or cavity containing gas or liquid but without a lining membrane.

209: MAJOR JOINT & LIMB REATTACHMENT PROCEDURES OF LOWER EXTREMITY

Procedures: DRG 209 includes but is not limited to, hip, knee, ankle replacements, and foot, leg, ankle and thigh reattachment.

The top operation/procedure codes most commonly used in Nevada in 2004, for this DRG were total knee replacement (ICD-9 code 81.54), total hip replacement (ICD-9 code 81.51), partial hip replacement (ICD-9 code 81.52), transfusion of packed cells (ICD-9 code 99.04), revision of knee replacement (ICD-9 code 81.55), and revision of hip replacement (ICD-9 code 81.53).

Definitions: **Hip replacement:** the substitution of an artificial ball and socket joint for the hip joint. **Knee replacement:** a surgical procedure in which injured or damaged parts of the knee joint are replaced with artificial parts. **Lower extremity:** part(s) of the leg(s). **Packed cells:** a preparation of blood cells separated from liquid plasma, administered to restore adequate levels of hemoglobin and red cells without overloading the vascular system with excess fluids.

Note: DRG 209 was discontinued October 1, 2005 and will be removed from Choices in the future.

210: HIP & FEMUR PROCEDURES EXCEPT MAJOR JOINT. AGE > 17 W CC

Procedures: Included, but not limited to, in this DRG are open reductions and closed reductions, internal fixations, bone grafts, and osteoclases of the femur. In Nevada in 2004, the most common operation/procedure codes under this DRG 210 were open reduction reduction of fracture with internal fixation of femur (ICD-9 code 79.35), closed reduction of fracture with internal fixation of femur (ICD-9 code 79.15), transfusion of packed cells (ICD-9 code 99.04), internal fixation of bone without fracture reduction (ICD-9 code 78.55), and removal of implanted devices from bone, femur (ICD-9 code 78.65).

Definitions: **Open reduction:** a surgical procedure for reducing a fracture or dislocation. **Closed reduction:** the manual correction of a fracture without an incision. **Internal fixation:** a method of holding together the fragments of a fractured bone. After open reduction of the fracture, pins, wires, screws, plates or nails may be used to stabilize the fragments. **Bone graft:** the transplantation of a piece of bone from one part of the body to another to repair a skeletal defect. **Osteoclasis:** the intentional surgical fracture of a bone to correct a deformity. **Femur:** the thigh bone that extends from the pelvis to the knee. It is the longest and strongest bone in the body. **Closed reduction:** the manual corrections of fractures without incisions.

243: MEDICAL BACK PROBLEMS

Diagnosis: Diagnoses under this DRG, include but are not limited to, displacement of lumbar intervertebral disc without myelopathy, spinal stenosis, lumbago, closed fracture of dorsal vertebra and closed fracture of lumbar vertebra.

The top diagnosis codes most commonly used in Nevada in 2004 for this DRG were closed fracture of lumbar vertebral column without mention of spinal cord injury, (ICD-9 code 805.4), lumbago (ICD-9 code 724.2), closed fracture of the dorsal, thoracic vertebral column without mention of spinal cord injury, (ICD-9 code 805.2), degeneration of lumbar or lumbosacral intervertebral disc, (ICD-9 code 722.52), and displacement of lumbar intervertebral disc without myelopathy (ICD-9 code 722.10).

Definitions: **Vertebra:** any one of the bones of the spinal column. **Intervertebral:** the space between two vertebrae. **Myelopathy:** disease of the spinal cord. **Stenosis:** an abnormal condition characterized by the constriction or narrowing of an opening or passageway in a body structure. **Lumbago:** pain in the lumbar, lower, region of the spinal cord caused by muscle strain, rheumatoid arthritis, osteoarthritis, or a herniated intervertebral disk. **Fracture:** a traumatic injury to a bone in which the continuity of the bone tissue is broken. **Dorsal:** the back of something.

294: DIABETES AGE > 35

Description: Diabetes is a disease in which blood sugar (glucose) levels are abnormally high because the body does not produce enough insulin. In Type 1 diabetes more than 90% of the insulin-producing cells of the pancreas are permanently destroyed. The pancreas produces little or no insulin. Most people who have Type 1 diabetes develop the disease before age 30. In Type 2 diabetes, the pancreas continues to produce insulin, sometimes even at higher than normal levels. However, the body develops resistance to the effects of insulin, so there is not enough insulin to meet the body's needs. Type 2 diabetes may occur in children and adolescents but usually begins in people older than 30 and becomes progressively more common with age.

Definition: Insulin: lowers blood glucose levels and promotes transport and entry of glucose into the muscle cells and other tissues. Insulin acts to regulate the metabolism of glucose and regulates the processes necessary for the metabolism of fats, carbohydrates and proteins.

296: NUTRITIONAL & MISC METABOLIC DISORDERS AGE > 17 W CC

Diagnosis: Included, but not limited to, in this DRG are malnutrition, nutrition deficiency, anorexia, feeding problems, hypovolemia, abnormal weight gain, abnormal loss of weight, and fluid overload.

The top diagnosis codes most commonly used in Nevada in 2004, for this DRG were disorders of fluid, electrolyte, and acid/base balance, volume depletion (ICD-9 code 276.5), hypopotassemia (ICD-9 code 276.8), hyposmolality and/or hyponatremia (ICD-9 code 276.1), anemia unspecified (ICD-9 code 285.9), and unspecified hypothyroidism (ICD-9 code 244.9).

Definitions: **Hypovolemia:** an abnormally low circulating blood volume. **Hyponatremia:** a lower than normal concentration of sodium in the blood. **Anorexia:** a lack or loss of appetite, resulting in the inability to eat. **Fluid overload:** an excessive accumulation of fluid in the body. **Malnutrition:** an imbalance between the body's needs and the intake of nutrients. Malnutrition includes undernutrition, in which nutrients are undersupplied, and overnutrition, in which nutrients are oversupplied. **Hypothyroidism:** a condition characterized by decreased activity of the thyroid gland. **Anemia:** a decrease in hemoglobin (a compound in the blood that carries oxygen to the cells from the lungs and carbon dioxide away from the cells to the lungs) in the blood to levels below normal.

316: RENAL FAILURE

Description: The kidneys are two fist-sized organs located on each side of the spine at the bottom of the rib cage and slightly above the waist.

Renal failure is the inability of the kidneys to excrete wastes, concentrate urine and conserve electrolytes. The condition may be acute or chronic. In chronic kidney disease, the kidneys have not stopped working altogether but are not working as well as they should. Acute renal failure occurs when the kidneys stop working over a period of hours, days or in some cases, weeks. When acute renal failure occurs, wastes and excess waste products and excess water build up in the body which upsets the body's normal chemical balance. Substances that are normally needed for the body to function properly become poisonous to the body when they reach abnormally high levels.

Diagnosis: The top diagnosis codes most commonly used in Nevada in 2004, for this DRG were acute renal failure (ICD-9 code 584.6), hypertensive renal disease, unspecified, with renal failure (ICD-9 code 403.01), disorders of fluid, electrolyte, and acid/base balance, volume depletion (ICD-9 code 276.5), heart failure (ICD-9 code 248.0), fluid overload, (ICD-9 code 276.6).

320: KIDNEY & URINARY TRACT INFECTIONS AGE > 17 W CC

Description: The urinary tract consists of the kidneys, ureters, bladder and urethra, all organs and ducts involved with the secretion and elimination of urine from the body. A urinary tract infection can occur in one or more structures of the urinary tract. A urinary tract infection is more common in women than in men.

Definitions: Pyelonephritis: a kidney infection, usually from bacteria that spread from the bladder. An untreated or recurrent kidney infection can lead to chronic pyelonephritis, scarring of the kidneys, and permanent kidney damage. **Interstitial cystitis:** a chronic inflammation of the bladder wall. Its cause is unknown. **Common cystitis:** a urinary tract infection caused by bacteria and is usually successfully treated with antibiotics. Interstitial cystitis is believed not to be caused by bacteria and does not respond to conventional antibiotic therapy. **W CC:** with complications and comorbidities (an accompanying illness/es).

359: UTERINE & ADNEXA PROC FOR NON-MALIGNANCY W/O CC

Procedures: Procedures under this DRG include, but are not limited to, open uterine biopsy, total abdominal hysterectomy, removal of the fallopian tube and ectopic pregnancy, and manual rupture of an ovarian cyst.

Definitions: **Uterus:** a pear-shaped, hollow organ located in the pelvis of females. In pregnancy, it is the organ that holds the unborn developing fetus. **Adnexa:** tissues or structures that are adjacent or near the uterus, such as the ovaries and fallopian tubes. **Hysterectomy:** the surgical removal of the uterus. **Ectopic pregnancy:** also known as a tubal pregnancy is a potentially life-threatening form of pregnancy in which implantation of the fertilized egg occurs outside the uterus. **Ovarian cyst:** a sac filled with fluid or semisolid material that develops in or on the ovary. **W/O CC:** without complications and comorbidities (an accompanying illness/es). **Non-malignancy:** not cancer. **Fallopian tube:** one of a pair of ducts, one opening at one end into the uterus and the other end into the peritoneal cavity over the ovary.

373: VAGINAL DELIVERY W/O COMPLICATING DIAGNOSIS

Diagnosis: Diagnoses included in this DRG include, but are not limited to, normal delivery, drug dependence-delivered, twin pregnancy- delivered, premature rupture of membranes-delivered, breech presentation-delivered, maternal stress-delivered, and cord prolapse-delivered.

The top diagnosis codes most commonly used in Nevada in 2004, for this DRG were single liveborn (ICD-9 code V27.0), first degree perineal laceration, delivered, with or without mention of antepartum condition, (ICD-9 code 664.01), second degree perineal laceration, with or without mention of antepartum condition (ICD-9 code 664.11), other and unspecified cord entanglement without mention of compression, with or without mention of antepartum condition (ICD-9 code 663.31), normal delivery (ICD-9 code 650).

Procedures: Operating room procedures include, suture of vaginal laceration, and repair of an obstetrical laceration to the cervix.

Definitions: **Antepartum:** begins with conception and ends with the onset of labor. **Vaginal delivery:** the birth of a fetus through the vagina. **W/O complicating diagnosis:** without a complicating diagnosis.

391: NORMAL NEWBORN

Description: On average, birth weights range from five pounds five ounces to eight pounds. The pulse of a newborn ranges from 100 to 170 beats per minute when awake, 70 to 80 when sleeping deeply. They take an average of 30 to 50 breaths per minute. Nearly all fair-skinned babies are born with blue or gray eyes, which may gradually change color over the first 12 months. Darker-skinned babies most often are born with brown or darker eyes, which usually stay that color. Dark-haired babies usually stay that way, but blond hair often darkens with age. Newborn babies have a soft spot, also known as the fontanel, that is diamond shaped just above the hairline, where the baby's skull bones have not yet fused together.

416: SEPTICEMIA AGE > 17

Diagnosis: Diagnoses under this DRG include, but are not limited to, streptococcal septicemia, septicemia due to Escherichia coli, and staphylococcal aureus septicemia.

Definitions: Septicemia: an infection present in the circulating blood, having spread from an infection in any part of the body. It is diagnosed by a culture of the blood and is treated with antibiotics. Septicemia causes fever, chills, hypotension, pain, headache, nausea or diarrhea. **Severe sepsis:** occurs when the body's normal reaction goes into overdrive, setting off a series of events that can lead to widespread inflammation and blood clotting throughout the body, causing tissue damage, leading to organ failure. **Septic shock:** occurs in severe sepsis when the cardiovascular system fails and blood pressure drops, depriving vital organs of oxygenated blood.

430: PSYCHOSES

Diagnosis: Diagnoses in this DRG include, but not limited to, paranoia, bipolar affect, schizophrenia-chronic, and recurrent manic disorder-severe.

The top diagnosis codes most commonly used in Nevada in 2004, for this DRG were schizo-affective type, unspecified (ICD-9 code 295.70), unspecified psychosis (298.9), bipolar affective disorder, unspecified (ICD-9 code 296.7), major depressive disorder, single episode, unspecified (ICD-9 code 296.2), and major depressive disorder, recurrent episode, unspecified (ICD-9 code 296.30).

Definitions: Psychosis: any major mental disorder that causes a person to lose his or her sense of reality. People with psychosis have hallucinations, delusions, or disorganized thinking that causes them to lose touch with reality. Someone who is psychotic may hear voices that no one else can hear, or perceive threats that are not real. It is often characterized by regressive behavior, inappropriate mood and affect, and diminished impulse control. **Bipolar affect:** a major mental disorder characterized by episodes of mania, depression, or mixed mood. **Schizophrenia:** psychotic disorder characterized by gross distortion of reality, disturbances of language and communication, withdrawal from social interaction and fragmented thoughts, perception and emotional reaction. **Depression:** an abnormal emotional state characterized by exaggerated feelings of sadness, dejection, worthlessness, and hopelessness that are out of proportion to reality.

449: POISONING & TOXIC EFFECTS OF DRUGS. AGE > 17 W CC

Description: Poisoning is a condition produced by the ingestion of, injection of, inhalation of, or exposure to a poisonous substance. According to the Center for Disease Control and Prevention a poisoning is a poison exposure that results in bodily harm. Poison exposures can occur by accident without intent, these exposures are defined as unintentional poisonings. Poison exposures can be the result of a conscious, willful decision, defined as intentional poisonings. Identification of the poison and presentation of a container label are critical to diagnosis and treatment.

In 2004, in Nevada, the age adjusted death rate, caused by poisoning (intentional and unintentional) was 16.4 per 100,000 population, up from 2003, when the rate was 15.1. In 2002 the rate was 13.5.

In 2004, in Nevada the age group with the highest death rate, caused by poisoning (intentional and unintentional) per 100,000 population, was the 31-45 years age group, with a rate of 26.5, the next highest age group, was the 46-60 years age group with a rate of 25.7.

494: LAPAROSCOPIC CHOLECYSTECTOMY W/O C.D.E. W/O CC

Procedure: Laparoscopic cholecystectomy is the surgical removal of the gall bladder with the assistance of a laparoscope (a small video camera attached to a tube). In laparoscopic surgery, the abdomen is inflated with carbon dioxide to provide more room for the procedure. Through a small incision made at the navel, a laparoscope is inserted into the abdomen. Three small additional holes are made to allow the entry of surgical instruments. The gallbladder is located and removed. Laparoscopic surgery has a lower rate of complications, a shorter hospital stay, and better cosmetic results than the open procedure.

Diagnosis: The top operation/procedure codes most commonly used in Nevada in 2004, for this DRG were laparoscopic cholecystectomy (ICD-9 code 51.23), intraoperative cholangiogram (ICD-9 code 87.53), endoscopic sphincterotomy and papillotomy (ICD-9 code 51.85), endoscopic removal of stone(s) from biliary tract (ICD-9 code 51.88), and endoscopic retrograde cholangiopancreatography (ERCP) (ICD-9 code 51.10).

Definitions: **W/O CDE:** without common duct exploration. **W/O CC:** without complications and comorbidities. **Cholangiogram:** an x-ray film of the bile ducts after injection of radiopaque contrast medium.

498: SPINAL FUSION EXCEPT CERVICAL W/O CC

Diagnosis: The top diagnosis codes most commonly used in Nevada in 2004, were degeneration of lumbar or lumbosacral intervertebral disc (ICD-9 code 722.52), displacement of thoracic or lumbar intervertebral disc without myelopathy, unspecified (ICD-9 code 722.10) acquired spondylolisthesis (ICD-9 code 738.4) spinal stenosis of lumbar region (ICD-9 code 724.02), and lumbosacral spondylosis without myelopathy (ICD-9 code 721.3).

Description: Spinal fusion involves surgical treatment of abnormalities in the spine bones (vertebrae). The surgery stabilizes the back by fusing certain vertebrae together with bone grafts or metal rods. The most common spinal area involved is the lower (lumbar) spine.

Definitions: **W/O CC:** without complications and comorbidities (an accompanying illness/es). **Cervical:** pertaining to the neck or the region of the neck. **Spondylolisthesis:** the partial forward dislocation of one vertebra over the one below it. **Spondylosis:** a condition of the spine characterized by fixation of a vertebral joint. **Myelopathy:** any disease of the spinal cord. **Stenosis:** an abnormal constriction or narrowing of an opening or passageway in a body structure.

500: BACK & NECK PROCEDURES EXCEPT SPINAL FUSION W/O CC

Description: Procedures included in this DRG include, but are not limited to, spinal cord exploration, excision of a spinal cord lesion, vertebral fracture repair, and insertion of a spinal stimulator. The spinal cord is an extension of the brain. It is protected by a bony structure called the vertebral or spinal column. There is a wide space that surrounds the spinal cord. This space contains the cerebrospinal fluid. All the information going from the brain to the limbs travels through the spinal cord. This then allows for movement. The spinal cord is the first relay station for sensory information (what we feel in our arms and legs) on its way to consciousness in various centers of the brain. In Nevada in 2004, the most common operation/procedure codes under DRG 500 were excisions of intervertebral disc(s) (ICD-9 code 80.51), explorations and decompressions of the spinal canal (ICD-9 code 03.09), injection of other agent into spinal canal (ICD-9 code 03.92) and injection of steroid (ICD-9 code 99.23).

Definitions: **W/O CC:** without complications and comorbidities (an accompanying illness/es). **Exploration:** surgical intervention to find the cause of a disorder by opening a body cavity and examining the interior. **Decompression:** the removal of pressure.
