Foreward

Provider Preventable Conditions is a joint publication of the Comagine Health and the Nevada Health Authority. This report presents general acute care hospital inpatient discharge billing records data as reported by Nevada’s general acute care hospitals that discharged patients within the period.

The data are available through the standard Uniform Billing form, which is utilized by hospitals to bill for hospital charges.

The data were compiled by Comagine Health using information from inpatient hospital billing records. This information was gathered and analyzed as part of a contractual agreement between the Department of Health and Human Services and Comagine Health under the authority granted in Section 439B of the Nevada Revised Statutes. Comagine Health reviews the data and requests corrections when errors are found. It is not possible to detect all errors. Comagine Health is not responsible for errors that cannot be found by a review.

Provider Preventable Conditions, Calendar Year 2022 through 2024

Published November 2025

Introduction

This Provider Preventable Conditions report compares 26 of Nevada's general acute care hospitals with respect to 11 common conditions that can be prevented from arising in a medical setting. Note that Critical Access Hospitals (CAHs) are excluded from this report. Because CAHs do not submit present on admission indicators with their UB04 claims, there is no way to determine if the patient had a condition when they entered the hospital or if they acquired it during their stay.

Definition of Provider Preventable Conditions

A provider preventable condition (PPC) is defined as "harm experienced by a patient as a result of medical care, or harm that occurs in a medical setting, unrelated to the reason for the patient visit."

Provider preventable conditions (PPC) were formerly known as healthcare acquired conditions (HAC). The term "provider preventable condition" is sometimes substituted with "adverse event," "never event" and "serious reportable condition." Though it is presently understood there are subtle differences in the meanings of these terms, readers will notice that in the past, state and federal documents have used these terms interchangeably.

Who is Responsible for Provider Preventable Conditions (PPC)?

The existence of a PPC is not a statement of blame or culpability. For example, PPC 6 is "falls/trauma." Just as an individual can fall and break a hip while walking through the home, the same can occur in a room at a health care facility while walking to the restroom. If a patient falls at a medical facility, even if there is no injury, the facility is required to code the incident, and it may be displayed below. The posting of a PPC is not a report on incompetence or carelessness. PPC 2 is "foreign body" left in patient. This can mean a surgical sponge or utensil left in a patient after surgery (and this would be an error), but it can also signify a good judgement call by an experienced physician. For example, while a physician is setting and anchoring a compound fracture, a screw may break within the bone. The physician may correctly choose to leave the screw fragment within the patient, as removing it may cause unnecessary trauma. This situation may be coded as a PPC for foreign body left in patient but is not a sign of incompetence.

Report Purpose

The purpose of posting these events is to look at the big picture. In any endeavor, including medical care, there is always room for improvement. Although not all PPCs are preventable, a high rate of PPCs may suggest room for improvement. Medical facilities can view this page as an indicator where resources should be applied. This information can assist in the development and enhancement of existing safety policies. When the user views the PPCs, it is important to remember there is not enough information to make a judgment call on a hospital. Some hospitals specialize in difficult cases and may have higher rates of PPCs. Some PPCs are difficult to code, as the attending physician may not have enough information to determine if the PPC occurred at their facility, or if the patient arrived with the condition. Even under these circumstances of missing information, the PPC is still counted and displayed on this website.

Understanding Counts and Rates

The reader will notice counts and two rate values are displayed. If only counts were displayed, large medical facilities would be misrepresented by appearing worse than small facilities. If only rates were displayed, small facilities would be misrepresented, as the addition of a single PPC at a small facility causes a large increase in the rate.

Displaying rates per 1,000 discharges is a national norm, but it doesn't present the entire picture. At times, a patient may reside at a facility for many days. This could be due to a chronic illness, insurance requirements or other reasons. Each day a patient remains at a medical facility, that patient has the potential of falling, getting a bed sore, acquiring a catheter infection and so on. Displaying a rate by 1,000 bed days compensates for this.

Report Navigation

This report includes inpatient admissions from acute care hospitals where the visit occurred in calendar year 2022 through 2024.

Each PPC is introduced with a short narrative that describes the PPC.

After the narrative, a series of tables and charts are presented that include the number of discharges, the number of PPC discharges, PPC discharges per 1,000, and PPC days per 1,000. The first table presents statewide averages along with gender and age breakdowns. The first table is followed by three charts to illustrate that same information. Following the charts will be three tables that contain the information by hospital for Clark, Washoe/Carson City and rural counties.

Note that a hospital discharge that involves more than one PPC will be reported under more than one PPC category.

It should be noted that when comparing hospitals, information based on small numbers of cases cannot provide a reliable statistical base upon which information can reflect a given hospital's experience. Rows that include five or fewer discharges are suppressed in this report, but caution should still be used when interpreting the data.

Comagine Health receives patient discharge records directly from all the hospitals included in this report.

General Acute Care Hospitals

Note that Critical Access Hospitals (CAH) are excluded from this report. CAHs are exempt from reporting “present on admission” information, which is a critical piece of data for identifying PPCs. For this reason, they are not included in this report.

Provider Preventable Conditions – Discussion and Graphics

1. Catheter-Associated Urinary Tract Infections

If proper sterilization procedures are not followed, bacteria or other microorganisms can enter the urinary tract through the catheter and multiply leading to an infection.

4. Stage III and IV Pressure Ulcers

A stage III pressure ulcer is serious wound that extends through the full thickness of the skin and into the subcutaneous tissue (the tissue beneath the skin). A stage IV pressure ulcer is an ulcer that extends through the full thickness of the skin and subcutaneous tissue, reaching deeper into underlying muscle, tendon, or bone.

7. Deep Vein Thrombosis (DVT) / Pulmonary Embolis (PE) with Total Knee OR Hip Replacement

Deep Vein Thrombosis (DVT) occurs when a blood clot forms in one of the deep veins of the usually in the leg. After total knee or hip replacement surgery, patients are at an increased risk of developing DVT due to immobility or changes in blood flow. A Pulmonary Embolism (PE) is when a blood clot usually from a DVT in the legs breaks and travels through the bloodstream to lodge in the arteries of the lung.

11. Air Embolism

PPC11 Surgical site infection that occurs after reducing the size of the stomach or altering the digestive system.

An air embolism occurs when air or gas bubbles enter a person's bloodstream and can causes adverse effect, including blockages of blood vessels, organ damage, and even death. Air embolism can occur during medical procedures or intervention, such as central line, surgery, or certain diagnosis tests.

No hospitals reported an air embolism that developed during an inpatient hospitalization.

12. Blood Incompatibility

PPC12 Infection that develops following orthopedic procedures involving the spine, shoulder, or elbow.

This refers to a medical situation where a patient receives blood product that are not compatible with their blood type or have specific antibodies that react adversely to the donor's. The condition arises when a healthcare provider administer blood transfusions or blood products without properly matching the donor blood with the recipient's blood type.

No hospitals reported blood incompatibility that developed during an inpatient hospitalization.

13. Surgical Site Infection - Mediastinitis after Coronary Artery Bypass Graft (CABG)

PPC13 Infection at device site after procedures involving the implantation of cardiac devices.

Infection that occurs in the mediastinum, the space in the chest between the lungs, after a CABG procedure.

14. Surgical Site Infection - Bariatric Surgery

PPC14A collapsed lung occurs during insertion or management of a venous catheter. Pneumothorax is the presence of air gas in the pleural space.

Surgical site infection that occurs after reducing the size of the stomach or altering the digestive system.

No hospitals reported a surgical site infection that developed after a bariatric surgery.
